

```
//STRING IN JAVA
```

```
//In Java we can also use strings, in fact there is no primitive type "string" in Java,  
//strings in Java are an address to a memory space that stores a set characters.
```

```
public class StringInJava {
```

```
    public static void main(String[] args){
```

```
        //See, strings always be written with double quotes, and the word "string" starts with a capital letter
```

```
        String word = "word";
```

```
        System.out.println(word); // => word
```

```
    }
```

```
}
```
